

How Segmentation Reduced Processing Costs

ABOUT THE CUSTOMER

A retail broker representing the nation's leading insurance companies, located in the Northeast US, with nearly \$4 million in revenue.

THE CHALLENGE

When analyzing the renewal processing costs for the retail broker, ReSource Pro found that more than 50 percent of all accounts had revenues that were below the average renewal processing cost. After subtracting the cost from the agency's revenues, the impact was a loss of over \$300,000 annually for the business.

This highlighted the need for the broker to better understand their clients, including what level of effort and resource expenditure can be allocated while still resulting in a profit. To accomplish this with maximum efficiency, an organized and systematic approach was necessary.

THE SOLUTION

In partnership with the retail broker, ReSource Pro's Operations Advisory team recommended a multi-prong solution:

- Analyzing the profitability of each account allowed us to identify and segment accounts by categories based on the level of time and resources that should be devoted to them.
- Segments where accounts are less profitable underwent optimization by reducing or eliminating processes. This could be via producer involvement, in-person meetings or marketing to several carriers, among other things.
- ReSource Pro's analysis identified the processing costs in the business' commercial lines and small business units. The results found over half of the accounts remaining with the commercial lines unit were unprofitable. This discovery allowed the company to transition these accounts to the small business unit and increase their profitability.
